

An airport lookout tower so tall that it not only looks over the airport but can also survey most of the city's western lands.

The spread wings of a bird inspire the shape of the main building

The runway on the sea is linked to a military base allowing for the runway to be a mode of emergency transport that connects the army to all parts of the city.

All cities need a good airport and so does the Wolf Lego City. The main building is designed like a seagull. A bird that is native to the Wolf City and one that can land and rest in the middle of the ocean. Thus it was a good metaphor for the Wolf island nation whom is located in the middle of the ocean. Airports however do take up a lot of land and that is simply not something this small island nation has in abundance. Thus most of the airport is built upon reclaimed land and all the runways are themselves on the sea. Being very close in proximity to the city's built environment there were many challenges with noise and pollution to overcome. Various technologies were used to help residential and commercial areas close to the airport to exist in peace and harmony. Special sound proofing devices are scattered in the sea areas immediately surrounding the runways. The tarmac itself is built from a sound and pollution absorbing material.

Wolf City Airport
