

THE WOLF HANDRAIL

Like all WOLF Projects, the WOLF handrail was custom designed and built to the highest of standards. The handrail was designed by WOLF Architects specifically for the WOLF House. Like any true custom design, the timber was selected and sourced to match the staircase, this also meant that different species were required to match the timber stairs going up through the stair void.

The design was driven by ergonomics thus the handrail features a carefully considered profile that allows the hand to wrap comfortably around. The upper edge is raised providing a substantial edge and cavity for grip and finger placement. The underside is designed to allow your thumb to rest easily whilst gripping the handrail with ease. During the design of the handrail the shape of the hand and natural placement were studied to determine the basis of the design, prototypes were also created to ensure the design met the brief's functional and aesthetic requirements.

In application the WOLF handrail is elegant, sophisticated and most importantly practical. Like all WOLF Architecture this is not only a functional design but a beautiful example of what happens when superb design, form and function meet.
