

Wolf City Sky Train

The Wolf City Sky Train also known as the WTS is an innovative mass public transport system, similar to Singapore's MRT and Bangkok's BTS. This train system allows for Wolf City's population to conveniently get around the city via an extensive network in which trains travel both above and below ground. While there are some trains that run underground the majority of trains will travel above ground, hence the nickname "Sky Train".

The transport system was conceived in the very early stages of planning the nation, this has allowed for the railway station sites to be carefully considered. The aim for the transport system is for it to never take the commuter more than 15 minutes to walk from any location to the conveniently positioned stations. In many instances the railway stations connect directly with the various Wolf City Buildings. Considering the transport system at the early stages has also allowed for the roads and highways to be wide enough for the railways to come at a later stage as the city is developed and the railways are gradually integrated.
